Turbocharger oil drain pipes are components used in turbocharging systems of internal combustion engines. Turbochargers are devices that increase the airflow into the engine, resulting in improved performance by forcing more air into the combustion chamber. In a turbocharging system, the turbocharger is driven by the engine's exhaust gases. As the exhaust gases pass through the turbine side of the turbocharger, they spin the turbine wheel. This spinning motion is then transferred to the compressor side of the turbocharger, where fresh air is compressed and forced into the engine's intake manifold.
