Turnout Measurement System is a railway inspection solution used to measure the geometry and condition of turnouts, switches, and crossings so maintainers can verify compliance, identify deterioration, and prioritize corrective work before it drives derailment risk or service disruption. In practice, these systems are deployed on dedicated inspection vehicles, measurement trolleys, or modular add-on packages, and they capture key turnout parameters using contact or non-contact sensing such as lasers and cameras, often combining geometry, rail profile, and component observation into a consistent dataset for maintenance decision-making.
