A twin engine marine gearbox is a type of transmission system used in boats and ships that have two engines. It is designed to transmit power from the engines to the propellers, allowing for efficient propulsion and maneuverability.

The twin engine marine gearbox typically consists of multiple gears and shafts that are interconnected to transmit power from the engines to the propellers. It allows for independent control of each engine, enabling the operator to adjust the speed and direction of each propeller separately.

This type of gearbox is commonly used in larger vessels, such as commercial ships, ferries, and yachts, where the use of two engines provides redundancy and increased power. It allows for better maneuverability, especially in tight spaces or when precise control is required.

Twin engine marine gearboxes are typically designed to handle high torque and power loads, ensuring reliable and efficient operation. They are often equipped with features such as hydraulic clutches, oil cooling systems, and multiple speed ratios to optimize performance and adapt to different operating conditions.
