The global Twin-Jet Electropolisher market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A twin-jet electropolisher is a device used for precise thinning of metal materials. It utilizes the principle of electrolysis to gradually reduce the thickness of the sample by spraying electrolyte from twin nozzles onto the sample. Twin-jet electropolishers are widely used in materials science, metal physics, electron microscopy, and other fields to prepare thin film samples, observe the microstructure of materials, and study material properties.

The twin-jet electropolisher industry has been steadily growing in recent years. As scientific and technological advancements and the demand for materials research continue to increase, the applications of twin-jet electropolishers are also expanding. At the same time, instrument manufacturers are continuously developing higher-performance and easier-to-operate twin-jet electropolishers to meet the needs of different users. It is foreseeable that the twin-jet electropolisher industry will continue to grow in the future.
