The twin-screw continuous pulping system is a piece of equipment used in the paper and textile industries to continuously stir, shear and process pulp or cellulose materials. The system consists of two screws that rotate in opposite directions. The screws are closely connected. One screw is responsible for transporting the raw materials, and the other screw is responsible for shearing and mixing the raw materials. This system can efficiently mix raw materials evenly, improving production efficiency and product quality. At the same time, the twin-screw continuous pulping system can also be adjusted according to different process requirements to meet the production needs of different products.

The global Twin-Screw Continuous Pulping System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
