The global Two-Phase Liquid Cooling System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A two-phase cooling system is an advanced thermal management solution designed to efficiently dissipate heat from electronic components and systems through the phase change of a working fluid. This system operates by immersing components in a dielectric fluid, which has the capability to absorb heat. As the fluid heats up, it evaporates into vapor, effectively transporting heat away from the source. The vapor then rises to a condenser, where it cools and condenses back into liquid form, releasing the absorbed heat. This cycle allows for high heat transfer coefficients, significantly improving thermal performance compared to traditional cooling methods.
