The two-photon microscopy system is a high-end microscopic device that combines two-photon excitation technology and laser scanning control technology. Its core principle is to use two long-wavelength photons to simultaneously excite fluorescent molecules and achieve high-resolution, low-phototoxicity imaging of biological samples through high-energy mode-locked pulsed lasers. This technology has the advantages of strong tissue penetration and precise spatial point focusing, and is widely used in neuroscience, tumor immunity, drug development, skin testing, disease diagnosis, and skin care product efficacy evaluation.
