Two-Photon Polymerization 3D Printing is an advanced additive manufacturing technique that utilizes the nonlinear two-photon absorption process to polymerize materials with high precision. This method allows for the creation of intricate micro- and nanoscale structures with exceptional detail and resolution. By focusing a femtosecond laser beam into a photosensitive resin, it enables the fabrication of complex geometries and fine features that are difficult to achieve with traditional 3D printing technologies. This technique is widely used in fields such as microengineering, biomedical applications, and optical devices.

The global Two-Photon Polymerization 3D Printing market size is projected to grow from US\$ 67.5 million in 2024 to US\$ 193 million in 2030; it is expected to grow at a CAGR of 19.1% from 2024 to 2030.
