The global Two-position Four-way Valve market size is predicted to grow from US$ 8028 million in 2025 to US$ 10450 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

A two-position four-way valve is a special solenoid valve. Two-position means that the valve has only two stable working states, namely on and off (or open and closed). Four-way means that the valve has four connection ports, which usually include two air inlets (or working ports) and two air outlets (or another working port and an exhaust port). These ports can be connected to different oil pipes or air pipes in the system, and the fluid on and off between different ports can be controlled by the movement of the valve core. The working principle of the two-position four-way valve is mainly based on the principles of electromagnetic induction and fluid mechanics. When the electromagnetic coil is energized or de-energized, a magnetic force will be generated to attract or release the valve core, thereby changing the switch state of the valve and realizing the switching of the fluid between two or more ports.

United States market for Two-position Four-way Valve is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
