Gyrocopter refers to an 'aircraft' that uses unpowered rotors to provide lift and is heavier than air. Thrust is provided by propulsion device, which includes propeller and jet. When moving forward, the air current blows the rotor to generate lift. It cannot take off vertically or hover. It often gives the rotor an initial power when taking off to increase its lift. With the help of the rotor, an approximate vertical landing can be made. The rotor makes the structure more complex and the speed increase is limited.
