Abstracts

The global TWS Headset Charging Box Management SoC market size is predicted to grow from US$ 1021 million in 2025 to US$ 2546 million in 2032; it is expected to grow at a CAGR of 14.2% from 2026 to 2032.

In 2024, the global production of TWS Headset Charging Box Management SoC will reach 2.961 billion units, with an average selling price of US$0.31 per unit. The TWS Headset Charging Box Management SoC is an integrated circuit designed specifically for true wireless earphones. The charging compartment battery charges the earphone battery, which in turn provides energy support for TWS earphones' numerous functions, including wireless music playback, voice calls, and noise cancellation. In this process, the power management chip plays a crucial role. The power management chip is primarily responsible for charging the battery inside the charging compartment and boosting the internal battery voltage output to charge the earphones. It also provides safety protection against overcharging, over-discharging, overcurrent, and short circuits in the built-in lithium battery. It improves battery charging speed, precisely controls current and voltage, and reduces damage to the earphone battery. Although the charging and discharging power of the charging box power management chip is relatively low compared to traditional devices, TWS earphones, which place extremely high demands on portability, have relatively higher requirements for high reliability, low power consumption, high efficiency, high precision, compatibility, and integration.

Challenges: Declining unit prices for TWS earbuds (-5% CAGR from 2020 to 2025) are forcing cost reductions for power management ICs. Opportunities: Features like AI noise reduction and spatial audio increase power consumption, driving the evolution of power management ICs toward higher efficiency (>95%). Technology drivers: Power SoC designs are becoming mainstream, reducing PCB area by over 40% and lowering

bill of materials (BOM) costs. Fast charging demand: A 10-minute charge for earbuds providing 2 hours of use is becoming standard, driving charging ICs to support faster charging rates than 3C devices. Increased wireless charging compatibility with the Qi standard is driving demand for wireless charging management ICs (e.g., the IP6816 with Qi receiver functionality).
