Anaphylaxis is an inappropriate reaction of the immune system to normal harmless substances. It generally has a rapid onset, strong reaction, and rapid subsidence. It has obvious genetic tendencies and individual differences. Currently, the prevalence of allergic diseases is increasing rapidly worldwide, affecting approximately 25% of the global population.

Abnormalities in type 2 immune pathways are important factors in inducing allergic diseases. Type 2 immune pathway refers to an inflammatory pathway in which Th2 cells (T helper 2) play a key role, and various cytokines such as IL-4, IL-5, IL-13, and TSLP are involved.

Depending on where the inflammatory reaction occurs, abnormal type 2 immune pathways can induce different allergic diseases, such as skin (atopic dermatitis, chronic spontaneous urticaria, etc.), respiratory tract (chronic sinusitis, asthma, chronic obstruction, etc.) lung disease, etc.), digestive tract (eosinophilic esophagitis), cardiovascular (eosinophilic granulomatous vasculitis), etc.

Biological targeted drugs mainly reduce the inflammatory response and activity of immune cells by binding to targets such as specific regulatory factors in the type 2 immune pathway; Small molecule targeted drugs include JAK inhibitors and TYK2 inhibitors, which exert immunomodulatory effects by blocking the JAK/STAT pathway. Compared with traditional anti-allergic drugs, targeted drugs have better efficacy in severe or drug-resistant patients, and the drugs themselves are safer, and have gradually become the mainstream trend in the development of anti-allergic drugs.

The global Type 2 Inflammation Targeting Drugs market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
