The global Type-B Antistatic Bulk Bag market size is predicted to grow from US\$ 754 million in 2025 to US\$ 1090 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global production of Type-B antistatic bulk bags reached 214 million units, with an estimated average selling price of US\$3.6 per bag. Type-B antistatic bulk bags are low-breakdown-voltage bags, typically made of non-conductive woven materials such as polypropylene (PP). Structurally similar to Type-A ordinary bulk bags, their fabric, coating, or lining system is designed for lower breakdown voltage, reducing the risk of high-energy spark discharge and propagating brush discharge. It's important to note that although Type B is called an 'antistatic bag,' it is not strictly a conductive bag, nor is it a true static dissipation bag. It lacks the grounding conductive network of Type C bags and the active static dissipation material mechanism of Type D bags. Instead, it limits dangerous discharge energy through a low breakdown voltage design. Its core design focuses on controlling a low surface/material breakdown voltage in the bag material, coating, or lining system to reduce the risk of spark discharge and propagating brush discharge. Applications are concentrated in the packaging of chemical powders, plastic resins, food powders, mineral powders, agrochemicals, pigments, some pharmaceutical intermediates, and dry flammable powders. The upstream of the industry chain includes PP resin, PP flat yarn, low breakdown voltage fabrics/coating materials, antistatic additives, UV stabilizers, PE lining film, sewing thread, straps, labels, and packaging accessories; the midstream includes drawing, weaving, coating, cutting, printing, sewing, lining lamination, breakdown voltage testing, and finished product testing; and the downstream includes the chemical, food, agrochemical, plastics, mineral, pharmaceutical, warehousing, and bulk logistics industries. Gross profit margin is in the range of approximately 20%-35%.
