The global Type B FIBC Ton Bag market size is predicted to grow from US\$ 754 million in 2025 to US\$ 1090 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global production of Type B FIBC ton bags reached 214 million units, with an estimated average selling price of US\$3.6 per bag. Type B FIBC ton bags are typically made of non-conductive polypropylene (PP) woven fabric. Unlike Type C bags, which are grounded via conductive threads, or Type D bags, which actively release charge through electrostatic dissipative fabrics, Type B bags are designed to control a low surface/material breakdown voltage in the bag material, coating, or lining system to reduce the risk of spark discharge and propagating brush discharge. Therefore, Type B bags can be used for some dry, flammable powders, but are not suitable for environments containing flammable gases, flammable solvent vapors, or highly sensitive explosive atmospheres. Applications are concentrated in the packaging of chemical powders, plastic resins, food powders, mineral powders, agrochemicals, pigments, some pharmaceutical intermediates, and dry flammable powders. The upstream of the industry chain includes PP resin, PP flat yarn, low breakdown voltage fabrics/coating materials, antistatic additives, UV stabilizers, PE inner lining film, sewing thread, straps, labels, and packaging accessories; the midstream includes drawing, weaving, coating, cutting, printing, sewing, inner lining lamination, breakdown voltage testing, and finished product testing; the downstream includes chemical, food, agrochemical, plastics, mineral, pharmaceutical, warehousing, and bulk logistics industries. Gross profit margins range from approximately 20% to 35%.
