Tyre Black Carbon Powder is a processed solid residue created from the pyrolysis of end-of-life tires. Recovered Carbon Black can be made from many types of rubber waste, but end-of-life tires are the most convenient because of their wide availability. The pyrolysis process recovers various virgin Carbon Black (vCB) grades and mineral fillers present in the rubber. The raw product is called a char, The char is further processed, milled, and pelletised to become recovered Carbon Black. Recovered Carbon Black contains around 20 per cent less carbonaceous material in comparison to virgin Carbon Black, because of the presence of minerals. However, Recovered Carbon Black is still a high-quality product with many applicable uses.

The global Tyre Black Carbon Powder market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
