## Abstracts

The global UAV-mounted IR Imagers and UV Imagers market size is predicted to grow from US\$ 866 million in 2025 to US\$ 1225 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

The UAV-mounted IR imager is a device installed on a UAV that detects the infrared radiation emitted from the surface of a target object and converts it into a visible thermal image. It utilizes the characteristic that objects emit infrared radiation of different intensities at different temperatures, enabling real-time acquisition of the target's temperature distribution and thermal state image without physical contact.

The UAV-mounted UV imager is an instrument carried by a UAV for detecting and capturing the UV radiation signals emitted by a target object and converting them into visible images. Its working principle is based on the fact that phenomena such as corona discharge generate UV light. By using a high-sensitivity UV detector to receive these UV signals and then processing and imaging them, operators can intuitively observe corona discharge, partial discharge, and other conditions on the surface of the target object.

United States market for UAV-mounted IR Imagers and UV Imagers is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
