The global UCIe Interface Chip market size is predicted to grow from US\$ 235 million in 2025 to US\$ 5066 million in 2032; it is expected to grow at a CAGR of 46.7% from 2026 to 2032.

UCIe Interface Chip refers to a die-to-die interface controller, PHY or related interface implementation based on the Universal Chiplet Interconnect Express standard. It enables chiplets from different functions or vendors to communicate inside advanced packages using a more standardized electrical and protocol interface. In 2025, global UCIe Interface Chip production reached approximately 900 K units.

UCIe is still at the early adoption stage, but it is important because it supports a more open chiplet ecosystem. The near-term market is led by IP licensing, prototype silicon and custom ASIC programs rather than very high-volume merchant chips.

Demand is strongest among AI accelerator, CPU and data-center ASIC developers that need to combine compute dies, I/O dies and memory interfaces in advanced packages. Standardization can reduce integration risk, but actual adoption still requires strong packaging design, signal integrity validation and interoperability testing.

The market outlook is high-growth from a small base. As more foundries, IP providers and system companies align around UCIe, production use should expand, but proprietary interfaces will remain common in vertically integrated flagship processors.
