The global UF Membrane Filter market size is predicted to grow from US\$ 454 million in 2025 to US\$ 674 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2025, global production of UF membrane filters reached 320,000 units, with an average selling price of USD 1,450 per unit, total production capacity of 380,000 units, and an average gross margin of 40%.

A UF membrane filter is a pressure-driven membrane separation device that uses ultrafiltration membranes as the core filtration medium. With typical pore sizes ranging from 0.01 to 0.1 micrometers, it effectively removes suspended solids, colloids, bacteria, some viruses, and macromolecular organic matter, while allowing water and small dissolved substances to pass through. UF membrane filters usually consist of membrane modules, housings, inlet and outlet connections, and backwashing structures, and can be used as standalone filtration units or as pretreatment for reverse osmosis and nanofiltration systems.

The upstream of UF membrane filters mainly includes suppliers of membrane materials (such as PVDF and PES polymers), membrane module manufacturers, and suppliers of housings, seals, and plastic or stainless-steel structural components. The midstream consists of UF membrane filter and water treatment equipment manufacturers responsible for product design, assembly, testing, and standardized production. Downstream customers mainly include municipal water and wastewater utilities, industrial users (such as electronics, food and beverage, pharmaceuticals, and chemicals), commercial buildings, and integrators of residential and small commercial water purification systems.
