UHF radio frequency label printer is a printing device that can read and write UHF (ultra-high frequency) RFID tag (also known as electronic tag) IC chip data, and at the same time visualize the data content on the label surface. RFID technology, namely wireless radio frequency identification technology, is a contactless automatic identification technology. It automatically identifies the target object and obtains relevant data through radio frequency signals. The identification work does not require human intervention and can work in various harsh environments. RFID tags are composed of antennas and chips. Each RFID tag has a unique electronic code and is attached to the object to identify the target object. UHF stands for ultra-high frequency radio frequency. In RFID technology, the UHF band usually refers to the frequency range of 860 to 960MHz. RFID tags in this frequency band are widely used in logistics, warehousing, retail and other fields due to their longer reading and writing distance and higher data transmission rate.

The global UHF Radio Frequency Label Printer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
