Ultra-clean high-purity reagents, also known as process chemicals, are chemical reagents whose impurity is greater than 99.99%, impurity ions and particle numbers meet strict requirements, and are one of the key basic chemical materials in the manufacturing process of integrated circuits and VLSI. Its main purpose is cleaning, etching, de-glueing, etc. Its purity and cleanliness have a very important impact on the yield, electrical performance and reliability of products such as integrated circuits and solar cells. The production and preparation process of ultra-clean and high-purity reagents is purified by using ordinary chemical reagents as raw materials. The current internationally used ultra-clean and high-purity reagent preparation technologies mainly include high-efficiency continuous distillation technology, gas cryogenic distillation and absorption technology, ion exchange technology, Membrane treatment technology, etc., They are suitable for the production of ultra-clean high-purity reagents with different ingredients and different requirements.
