The global Ultra Fine Copper Powder market size is predicted to grow from US\$ 473 million in 2025 to US\$ 693 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Ultra fine copper powder refers to copper-based powder with much smaller particle size than conventional copper powder, high specific surface area, and excellent electrical and thermal conductivity. It generally includes micron, submicron and nano copper powders produced by electrolysis, atomization, chemical reduction or wet-process synthesis, and is widely used in conductive pastes, electronic electrodes, printed circuits, powder metallurgy, friction materials, catalysts, shielding materials, additive manufacturing and thermal management applications. In 2025, global Ultra Fine Copper Powder production reached approximately 5632 MT.

Miniaturization and higher integration in electronics are key demand drivers for ultra fine copper powder. As consumer electronics, automotive electronics, communication devices and industrial electronics move toward smaller form factors, higher power density and better reliability, conductive pastes, terminal electrodes, shielding materials and fine-line circuit materials require tighter particle-size control, better morphology uniformity, stronger dispersion and improved sintering behavior. Compared with conventional copper powder, ultra fine copper powder is better suited for thin layers, fine conductive lines and dense conductive structures, which supports its use in multilayer ceramic components, thick-film pastes, flexible electronics and high-performance electrode materials.

The development of electric vehicles, power semiconductors and thermal management materials is also increasing the value of ultra fine copper powder. Electrified platforms

require more conductive, thermally conductive and bonding materials, while power device packaging, thermal interface materials, low-temperature sintering materials and reliable conductive coatings demand higher purity, better oxidation resistance and more precise particle-size control. Copper has strong intrinsic electrical and thermal conductivity and can serve as a cost-effective substitute or composite base for silver and other precious metal powders in selected applications.
