UHT processing is also known as ultra-high temperature processing or ultra-pasteurization. It is a food processing technology that sterilizes liquid food and beverage. UHT processing involves heating milk or cream to 138° to 150° C (280° to 302° F) for one or two seconds to kill harmful bacteria and microorganisms. Except for milk production, UHT processing is also used for fruit juices, cream, soy milk, yogurt, wine, soups, honey, and stews. UHT processing helps to increase the shelf life and

restore the value-added nutrients primarily in dairy products. The important characteristics of UHT systems include robust structure, precise production, and high operational efficiency, in throughput time. The primary purpose of UHT systems is to help maintain the nutrient content in the food & beverage, even after high-temperature heating. UHT systems are gaining popularity in the food & beverage processing sector across the globe.
