Ultra High Purity (UHP) Krypton refers to krypton gas refined to purity levels exceeding 99.999%, minimizing impurities such as nitrogen, oxygen, or hydrocarbons. Extracted via fractional distillation of liquefied air, it undergoes additional purification through gettering or adsorption to achieve parts-per-billion (ppb) contaminant levels. UHP Krypton's inertness and unique spectral properties make it critical in laser technologies (e.g., excimer lasers for semiconductor lithography), high-efficiency lighting (e.g., halogen lamps), and thermal insulation for double-pane windows. In aerospace, it serves as a propellant in ion thrusters due to its high density and non-reactivity. Strict handling protocols are required to maintain purity during storage and delivery, often using electropolished stainless steel cylinders.

United States market for Ultra High Purity Krypton is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
