The global Ultra Pure Indium market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Indium is a post-transition metallic element that is rare in Earth's crust. It has no obvious role in biological processes, but is of considerable industrial importance. The main source of indium is zinc concentrates (indium containing 0.0001 ~ 0.1%), recovered as a byproduct in the smelting of zinc ore and tin smelting process. Indium is mainly used for production of indium tin oxide (ITO), alloys and solders. Another important use of indium was for III-V semiconductor materials for light-emitting diodes (LEDs) and laser diodes. Some manufactures also extract indium from the waste electronic materials (ITO).
