Conventional LEDs are directionally efficient light sources and are therefore often used in a variety of lighting fixtures by controlling the light with secondary optics. However, due to their strong frontal light, there is a tendency for the emitting surface of the lighting fixture to be grainy. Therefore, lighting fixtures using conventional LEDs are designed to be thicker to avoid uneven lighting patterns.

Ultra-wide Light Distribution LED is a white LED that realizes a horizontal light distribution. Horizontal Light Distribution LED will contribute to thinner and lighter lighting fixtures and reduce the use of resources for lighting fixture designs as well as the building materials in which they are installed. In addition, the strong horizontal light creates a soft, low-glare light that envelops the entire environment.

The global Ultra-wide Light Distribution LED market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
