The ultracentrifuge rotor is the core component of the ultracentrifuge. It refers to a device that rotates at high speed in the centrifuge chamber to generate a strong centrifugal field. It is usually made of titanium alloy or aluminum alloy. It is designed with a support hole for placing centrifuge tubes inside to carry sample containers. The rotor is driven by a drive system to rotate at high speed, so that particles of different density, quality and properties in the sample can be separated, concentrated and purified under the action of centrifugal force. It is a key component that determines the centrifugal effect and safety.
