Abstracts

The global Ultrafast Laser Precision Micro-nano Processing Equipment market size is predicted to grow from US$ 1656 million in 2025 to US$ 6086 million in 2032; it is expected to grow at a CAGR of 20.8% from 2026 to 2032.

In 2024, the global output of Ultrafast Laser Precision Micro-nano Processing Equipment will reach 9880 units, with an average selling price of US$155,708 per unit. Ultrafast Laser Precision Micro-nano Processing Equipment offers superior performance, enabling single-step cutting and shaping without the need for secondary processing. With the development of 5G communications and smartphones, more and more fragile materials, such as flexible screens and flexible circuits, are being widely used in the manufacture of mobile phones and smart devices. Currently, fragile materials are commonly processed using traditional machine tool grinding, a contact process that is prone to edge chipping and hidden cracks, impacting product efficiency and quality. Ultrafast laser precision micro-nano processing uses high-energy laser pulses to break the material's molecular bonds, directly vaporizing the material. This enables cold cutting of fragile non-metallic materials, generating no heat and reducing the risk of defects, thereby improving efficiency and product yield. Downstream companies primarily include leading domestic and international consumer electronics companies such as Huawei, LINGYI iTECH, LuxshareTech, Foxconn, BYD, Sumida, BOE, Lens Technology, Jabil, Salcomp, and Yada Electronics.

Industry Barriers: The development of cutting technology for highly hard and brittle materials has seen cutting methods evolve through internal circular saw cutting, free abrasive slurry cutting, and diamond wire cutting. Each improvement has resulted in improved raw material utilization, increased cutting efficiency, and reduced cutting costs. Slicing ultra-thin silicon wafers is a demanding precision machining process that

requires high-precision cutting equipment, high-quality diamond wire, and highly adaptable cutting processes to ensure high-quality, efficient, and low-cost wafer production. Therefore, high-precision cutting equipment and high-quality diamond wire have high R&D and manufacturing requirements.

Market Drivers: With the development of 5G communications and smartphones, an increasing number of brittle and thin materials, such as flexible displays and flexible circuits, are being widely used in the manufacture of mobile phones and smart devices. Currently, these brittle and thin materials are commonly processed using traditional machine grinding, a contact-based process that is prone to edge chipping and hidden cracks, impacting product efficiency and quality. Brittle material processing equipment uses high-energy laser pulses to break the material's molecular bonds, directly vaporizing it. This enables cold cutting of brittle, thin non-metallic materials. This process generates no heat, reduces the risk of defects, and improves efficiency and yield. Since 2024, large-scale model technology has rapidly advanced, triggering a transformation in the interactive nature of smart mobile devices. Mobile phones have entered the AI ??era, and the new generation of AI-powered phones will undergo significant upgrades in storage, displays, imaging, and other features, ushering in a new cycle of innovation. Driven by AI innovation and national policy subsidies, demand in China's consumer electronics market is expected to rebound in 2024. According to IDC, smartphone shipments in China are projected to reach 286 million units in 2024, a 5% year-on-year increase, the first positive growth since 2022. OLEDs and 3D glass cover panels for mobile phone screens are the primary drivers of growing demand for precision micro- and nano-processing laser equipment. OLED is a next-generation display technology characterized by low power consumption, thinness, and flexibility. The widespread use of flexible OLED panels in smartphones has opened up new possibilities for protective glass design. 3D touch protective glass covers are highly compatible with OLED screens, making them appear larger and providing enhanced visual quality. 3D protective glass products offer advantages such as lightness, transparency, cleanliness, fingerprint resistance, anti-glare, and excellent weather resistance. They not only add a visual appeal to mobile phone screens, enhancing the novelty of smart terminal products, but also provide an excellent touch experience. As a result, their application is expanding, and the increasing demand for precision processing will drive market demand for laser processing equipment.
