Ultrafiltration Modules are key components used in water treatment and membrane separation processes. They are usually composed of a series of membranes with very small pore sizes that can filter out tiny particles, bacteria, viruses, organic matter and other dissolved substances in the water while allowing water molecules to pass through. These modules are often used to purify and treat water, such as in drinking water treatment, industrial wastewater treatment, food and beverage processing, etc. Ultrafiltration Modules use efficient membrane technology to achieve high water purification efficiency and energy efficiency ratio.

The global Ultrafiltration Modules market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
