An ultralow absorption lens is a precision optical component engineered to transmit high-intensity laser light with minimal absorption, thereby reducing thermal effects and enhancing performance in demanding applications. These lenses are typically fabricated from materials such as fused silica, zinc selenide (ZnSe), or sapphire, known for their excellent optical clarity and low intrinsic absorption across specific wavelength ranges. To further minimize absorption, advanced anti-reflective coatings are applied, achieving absorption rates as low as 0.1%. This combination of material selection and coating technology ensures that ultralow absorption lenses can withstand high laser powers without significant thermal distortion or degradation, making them ideal for use in high-power laser systems, precision machining, medical devices, and scientific research instruments.
