Ultrapure is the word used to describe water that meets strict limits on many or all of the following: biological organisms (such as pyrogens, bacteria or viruses), organic carbon, dissolved and suspended solids, and dissolved gases. Ultra-pure water is typically required in electronics, optical, and pharmaceutical manufacturing processes. Ultrapure water is also used in dialysis, research, and medical applications. Water must meet strict purity standards in order to be considered ultrapure. Ultrapure water standards are

established and published by several standards-setting organizations, such as: AAMI, USP, ASTM, ANSI, CAP, ISO 3696, and NCCLS. The ASTM, NCCLS, and ISO 3696 classify purified water as Type I, Type II, or Type III, with Type III being the least purified and Type I being the purest water. All these organizations have very similar parameters for classifying purified water into these three types. The purpose of classifying pure water into different types is to ensure that the right purity level is achieved for specific applications. Some lab and medical processes require higher-grade water purity than others do; thus, these classifications were developed to ensure that the right water purification level is used for any given application. Ultrapure water treatment is an efficient system producing exactly the correct type of ultrapure water needed for application.
