The global Ultrasonic Cleaning Systems for Medical market size is predicted to grow from US\$ 394 million in 2025 to US\$ 566 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

The intermediate and final cleaning of items such as implants, endoscopes and surgical instruments requires ultrasonic cleaning. This removes contaminants such as process residues, oil, polishing compounds, particulate, wax, and grease. A variety of liquid maintenance options ensure optimum performance time after time, and an oil separator gives the ability to use de-emulsifying cleaners. The different tank sizes make the units suitable for use in a production or maintenance environment. Ultrasonic cleaning is ideal for removing large quantities of contamination and for cleaning tasks that require a multi-stage process. The two different multi-frequency fields ensure real flexibility for the range, which allows for high precision cleaning as well as less arduous tasks.
