## Abstracts

The global Ultrasonic Frequency Induction Heating Equipment market size is predicted to grow from US$ 115 million in 2025 to US$ 180 million in 2031; it is expected to grow at a CAGR of 7.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Ultrasonic frequency induction heating equipment is an industrial equipment that uses the principle of electromagnetic induction to efficiently convert electrical energy into thermal energy, and heats metal materials quickly, locally, and contactlessly. Its operating frequency is usually between 10kHz and 100kHz, between high frequency and medium frequency, so it is called 'supersonic frequency'. The heating method of this equipment is to pass an alternating current through an induction coil to generate eddy currents in the heated metal workpiece, causing it to heat itself, thereby achieving the purpose of rapid heating. Due to its moderate frequency, the supersonic frequency equipment has achieved a good balance between heating depth and heating speed, and is particularly suitable for local heat treatment of small and medium-sized workpieces.

United States market for Ultrasonic Frequency Induction Heating Equipment is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
