Ultrasonic Lens Cleaning System is a technology used for the automated cleaning of camera lenses and other optical components using ultrasonic waves. This system typically consists of a cleaning tank filled with a specialized cleaning solution and equipped with ultrasonic transducers. When the lens is placed in the tank, ultrasonic waves are generated, causing the cleaning solution to produce millions of tiny bubbles through a process called cavitation. These bubbles then implode, creating tiny jets of liquid that dislodge dirt, dust, and other contaminants from the surface of the lens. Ultrasonic lens cleaning systems offer a gentle and efficient method for removing debris without causing damage to delicate optical surfaces, making them popular in professional photography, cinematography, and industrial optical applications.

The global Ultrasonic Lens Cleaning System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
