Bone growth stimulation, or BGS, is a form of therapy often used to promote healing after a spinal fusion surgery or fracture. BGS may promote faster natural healing in fractures that may be slow to heal on their own. Ultrasound is transmitted from a device and with a coupling gel applied to the skin over the site of the fracture. Ultrasound produces a wave, which sends a signal that applies a pressure to the bone. Bone growth stimulation is thought to result from this pressure, which is similar to mechanical pressure put on the bone.
