This report focus on Ultrasonic Passivation Systems. Ultrasonic Passivation Systems are used to perform the following operations: cleaning-rinsing-passivation-rinsing-drying. Passivation is a non-electrolytic process typically using nitric acid to remove free iron from the surface and form an inert, protective oxide layer that strengthens metals against rust and oxidation, making it a preferred method of corrosion control for many industries. Ideal for the medical device and aerospace industries, our processes and equipment are manufactured to the highest industry standards. Any industry that requires contaminate-free, corrosion-resistant parts and components can reap the benefits of having high quality Passivation Process Line.
