The global Ultrasonic Piezoelectric Motor market size is predicted to grow from US\$ 4886 million in 2025 to US\$ 6386 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

An ultrasonic motor is a type of piezoelectric motor powered by the ultrasonic vibration of a component, the stator, placed against another component, the rotor or slider depending on the scheme of operation (rotation or linear translation). Ultrasonic motors differ from other piezoelectric motors in several ways, though both typically use some form of piezoelectric material, most often lead zirconate titanate and occasionally lithium niobate or other single-crystal materials. The most obvious difference is the use of resonance to amplify the vibration of the stator in contact with the rotor in ultrasonic motors. Ultrasonic motors also offer arbitrarily large rotation or sliding distances, while piezoelectric actuators are limited by the static strain that may be induced in the piezoelectric element.

The growth of industries in various regions around the world contributed to the expansion of the ultrasonic piezoelectric motor market on a global scale.
