Ultrasonic polishing is actually a process of converting electrical energy into mechanical energy. The ultrasonic electrical signal is processed by the power amplifier and output to the working handle of the ultrasonic transducer by the ultrasonic host controller. The working handle of the ultrasonic transducer then converts the ultrasonic electrical signal into high-energy and high-speed mechanical vibration, and finally transmitted to the end of the tool head by the horn at the front end of the horn, And drive the grinding material suspension on the tool head to impact the surface of the polished workpiece at high speed, so as to achieve the mirror effect quickly.
