The ultrasonic reversing sensor is a vehicle auxiliary device used to assist the driver in parking operations when reversing to reduce the occurrence of collisions and accidents. It detects the distance of obstacles around the vehicle through an ultrasonic sensor installed at the rear of the vehicle, and then converts the detected distance information into a visual or sound signal and feeds it back to the driver to help the driver judge the distance, thereby reversing more safely. operate. The working principle of the ultrasonic reversing sensor is to use the echo of ultrasonic waves to measure the distance between the vehicle and the obstacle. When the vehicle approaches the obstacle, the ultrasonic sensor will detect changes in the echo signal, and the control module will determine the distance between the vehicle and the obstacle based on these signals. The distance of the obstacle is determined and a warning is issued to the driver through the display or alarm to help the driver take timely measures to avoid a collision. Ultrasonic reversing sensors are widely used in various automobiles and commercial vehicles. They are an effective vehicle safety auxiliary device that can improve the safety and convenience of drivers when reversing.
