The global Ultrasonic Roll Welding Equipment market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The ultrasonic rolling welding equipment generates high-frequency vibration waves through the ultrasonic generator, which are converted into mechanical vibration energy through the transducer and transmitted to the welding head. Under the action of the gas source, the welding head presses the workpiece downward to generate pressure and ultrasonic energy. This high-frequency vibration and pressure act together on the metal surface to be welded, causing the metal surfaces to rub against each other and form fusion between the molecular layers, thereby achieving welding.
