The global Ultrasonic Sample Processing System market size is predicted to grow from US$ 399 million in 2025 to US$ 620 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Ultrasound refers to mechanical waves with a frequency exceeding 20 kHz, which are widely used in medical fields such as disease diagnosis, cancer treatment, and drug delivery. The cavitation effect generated by ultrasound can be used to achieve functions such as cell disruption and tissue homogenization, so ultrasound technology can be used to process complex biological samples. Most of the ultrasonic disruptors on the market are contact type, and the transducer needs to be immersed in the sample solution. This method has the following defects: the transducer needs to be cleaned for each experiment, and the risk of cross-contamination cannot be completely avoided; the sound pressure distribution in the sample solution is uneven, which is not conducive to the repeatability of the experiment; the heat generated by the transducer is directly transferred to the sample solution, affecting the experimental results. Due to the above shortcomings of traditional contact ultrasonic instruments, non-contact ultrasonic technology has begun to attract the attention of researchers.

United States market for Ultrasonic Sample Processing System is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
