Ultrasonic underwater ranging sensor is a precision measuring device based on the propagation characteristics of ultrasonic waves. It is widely used in underwater detection, positioning and monitoring. Its working principle is to transmit ultrasonic signals through the sensor. When the ultrasonic wave propagates in the water and encounters the target object, part of the signal will be reflected back. The sensor calculates the distance or water depth of the target object based on the time difference between the transmitted and received signals and the propagation speed of the sound wave in the water. Ultrasonic underwater ranging sensor has the characteristics of high measurement accuracy, strong anti-interference ability and good environmental adaptability, and can provide reliable data support in complex underwater environments.

United States market for Ultrasonic Underwater Ranging Sensor is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
