The global Ultrasonic Wound Debridement Device market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An ultrasonic wound debridement device is a medical tool used to clean and treat chronic wounds by employing high-frequency sound waves. These devices generate ultrasonic vibrations that create microscopic bubbles in a liquid medium, which then collapse and produce mechanical forces to gently remove dead or infected tissue without harming healthy tissue. This method promotes faster healing by reducing bacterial load and enhancing blood flow to the wound area. Ultrasonic wound debridement is particularly beneficial for patients with non-healing or hard-to-treat wounds, offering a precise, painless, and efficient alternative to traditional debridement techniques.
