Uncoated Intermittent catheters are the traditional intermittent catheters. It is in practice to coat these catheters in a lubricating jelly or an anesthetic gel right before insertion.

A significant driver in the Uncoated Intermittent Catheters market is the increasing prevalence of urinary incontinence and the growing demand for effective urinary catheterization solutions. Uncoated intermittent catheters offer a straightforward and cost-effective method for managing urinary retention and promoting patient comfort. However, a notable challenge in this market is the need for infection prevention and user education. Ensuring that uncoated catheterization procedures are conducted hygienically, minimizing the risk of urinary tract infections, and educating patients on proper catheterization techniques poses a significant challenge. Healthcare providers

and manufacturers must prioritize infection control measures, patient training, and product innovation to enhance the safety and usability of uncoated intermittent catheters, ultimately improving the quality of life for individuals with urinary incontinence.
