The global Uncooled Infrared Fever Screening Thermographic Detectors market size is predicted to grow from US\$ 29.35 million in 2025 to US\$ 42.60 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Uncooled infrared fever screening thermographic detectors are infrared thermal imaging detectors, modules, cameras, or systems designed for non-contact screening of elevated human skin temperature. These products typically use uncooled microbolometer focal plane arrays, VOx detectors, amorphous silicon detectors, or thermopile arrays to capture infrared radiation from the human face, and combine radiometric calibration, blackbody reference, face detection, visible-light fusion, and temperature compensation algorithms to identify individuals with potential elevated body temperature. This study focuses on infrared detector cores, thermal imaging modules, thermal cameras, and complete fever screening systems used for human body temperature screening. Prices vary by detector type.

From a supply-side perspective, the infrared body temperature screening detector market has shifted from the surge in demand seen during public health emergencies back to replacement demand from existing installations in healthcare, transportation, public facilities, and key access-control locations. Core suppliers can be divided into two main categories: the first includes companies with complete thermal imaging camera and system capabilities, such as Teledyne FLIR, Dahua, Hikvision, Guide, and DALI; the second includes detector or module suppliers, such as GSTiR, Raytron, Lynred, Heimann, and Excelitas.

From the demand side, future growth is unlikely to repeat the explosive procurement cycle seen during the pandemic. Instead, demand will mainly come from replacement

needs at hospital entrances, border inspection checkpoints, industrial parks, schools, and key public facilities, as well as the integration of thermal temperature screening with security systems, access control, and AI-based facial detection systems. The FDA's warning about the risks of improper use of thermal imaging systems also indicates that, in medical settings, these products are more suitable as preliminary screening and alert tools, rather than standalone diagnostic devices.
