An uncooled infrared focal plane array (FPA) is a type of sensor used to detect infrared radiation without the need for cryogenic cooling, which is typically required for other infrared sensors. This technology utilizes materials like vanadium oxide or amorphous silicon that change resistance when heated by infrared radiation. These changes are detected and converted into electronic signals to form thermal images. Uncooled FPAs are widely used in thermal cameras, night vision devices, and various industrial applications due to their lower cost, smaller size, and reduced power consumption compared to cooled detectors. Despite having lower sensitivity and resolution than cooled counterparts, they are highly effective for many practical applications where extreme sensitivity is not critical.

The global Uncooled Infrared Focal Plane Array market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
