Boiler under dirt separator is a highly efficient impurity separation device specially installed at the bottom of the boiler. It uses the principles of fluid mechanics, through a specific internal structure design and filter media, to effectively separate solid impurities and suspended matter in the boiler circulating water, thereby preventing these impurities from entering the boiler body and causing damage. Dirt separators usually have a large processing capacity and high separation efficiency, which can ensure the long-term cleanliness and stability of boiler water quality. At the same time, its sturdy and durable material and convenient maintenance method also make it an indispensable protective device in the boiler system.
