The global Under-screen Optical Fingerprint Chips market size is predicted to grow from US\$ 2004 million in 2025 to US\$ 2898 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

The under-screen optical fingerprint chip is an advanced biometric technology that is widely used in mobile devices such as smartphones and tablets, realizing the function of fingerprint recognition under the display screen. This technology captures the user's fingerprint image through a sensor embedded in the screen and matches and verifies it with a pre-stored template, providing a safe and convenient unlocking experience and payment authentication. The working principle of the under-screen optical fingerprint chip is to use the self-luminous characteristics of the OLED screen. When the finger presses the screen, the light emitted by the screen illuminates the fingerprint, and then reflects back to the optical sensor located under the screen through the tiny pores in the screen substrate. After the sensor collects the high-resolution fingerprint image, it is analyzed by the image processing algorithm to complete the fingerprint recognition process.
