According to this study, the global Under-screen Optical Fingerprint Technology market size will reach US\$ 2703 million by 2031.

Under-screen optical fingerprint technology is a biometric solution integrated under the smartphone screen. It uses optical imaging principles to achieve user fingerprint recognition and identity authentication, and is widely used in mid-to-high-end smartphones and tablet devices. Its core principle is to set an optical sensor under the screen. When the user's finger touches the designated area of the screen, the screen backlight will illuminate the fingerprint area, and the light will penetrate the glass and reflect back to the sensor to capture the fingerprint texture image, and then perform an algorithm comparison with the pre-stored template.
