The underframe inspection robot for rolling stock is an intelligent automated equipment designed specifically for the inspection and maintenance of the underframe sections of railway rolling stocks. Incorporating advanced technologies such as modern sensor technology, machine vision, autonomous navigation, and remote control, this robot addresses the growing concerns and demands within the railway industry for the safety performance of underframe components. Its necessity arises because the underframe is a critical part that bears the weight of the train and transmits power, with its condition directly affecting the safe operation of the train and the safety of passengers. Traditional underframe inspection methods often require a significant amount of manpower and resources, and can pose safety risks. The underframe inspection robot for rolling stocks features autonomous movement, automatic positioning, and precise inspection capabilities, allowing it to conduct comprehensive and all-around checks of the underframe without disrupting the normal operation of the train. It can promptly detect issues such as cracks, wear, and corrosion. The advantages of this robot include significantly improving the efficiency and accuracy of underframe inspections, reducing the need for manual intervention, and thereby lowering safety risks and operational costs. Additionally, the robot can upload inspection data in real-time, providing the railway department with detailed maintenance information and facilitating a shift from reactive to proactive maintenance. Moreover, the underframe inspection robot for rolling stock can perform tasks in adverse weather conditions or hazardous environments, replacing human labor and enhancing the safety of railway maintenance personnel, while also improving the overall safety management level of the railway industry.
