The global Underground Stormwater Detention System market size is predicted to grow from US\$ 543 million in 2025 to US\$ 749 million in 2031; it is expected to grow at a CAGR of 5.5% from 2025 to 2031.

An underground stormwater detention system is a subterranean structure designed to manage excess rainwater accumulation during heavy rainfalls by temporarily storing it until the water can be released back into natural aquifers. This system helps mitigate flooding risks posed by sudden weather events while improving overall drainage capacity without sacrificing valuable surface area for traditional aboveground detention ponds that could otherwise have alternative uses like parking lots or gardens.

The global underground stormwater detention system market has experienced steady growth in recent years owing to increased focus on eco-friendliness, reduced carbon footprints, and heightened awareness surrounding climate change mitigation measures. As cities grapple with space limitations and denser population distribution requiring new development strategies addressing infrastructural demands in confined metropolitan regions, innovative solutions such as belowground stormwater management systems have gained popularity, particularly in developed countries already embracing green initiatives.
